

CB1000F8436A Series, Automotive, 0.1% Tolerance Operating Temperature -40°C~+105°C Shunt Based Current Sensor

1、Characteristics

- Current Sensing: Measurement Range: -22400A~+22400A
- Continuous Operating Range:-1000A~+1000A
 Measurement Accuracy: ±0.1% (MAX)
- Resolution: 1mA
- Temperature Sensing: Measurement Range: -50°C~+150°C
- Measurement Error: ±3°C
- Resolution: 0.1°C
- Communication Protocol:CAN2.0 A/B
- Selectable Data Format
- Configurable CAN ID
- Configurable CAN Speed: 250Kbps~1Mbps
- Supply Voltage:6V~18V
- Operating Temperature Range: -40°C~+105°C
- Power Consumption: ≤384mW @12VDC
- Galvanic Isolation: 3000VAC

2、Applications

- Automotive Current Monitor
- Grid Energy Storage
- UPS
- Charging Station

3、Introduction

CB1000F8436A current sensor is an automotive current sensing module, which can be used to measure bidirectional DC current. Featuring high accuracy, low power consumption, wide operating temperature range, excellent response speed, temperature stability and anti-interference ability.

The sensor is designed based on low-TCR shunt, adopts highprecision ADC, communicates through CAN2.0 A/B protocol, and has large ranges of current and temperature measurement capabilities, and current compensation at whole temperature range.

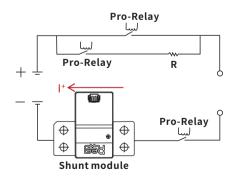

The sensor meets the operating temperature range of -40°C~+105°C, can apply to the continuous operating current of -1000A~+1000A at the whole temperature range, and the current measurement accuracy is no more than \pm 0.1% in the range of +50A~+1000A or -1000A~-50A.

Power supply of CB1000F8436A current sensor is from 6VDC to 18VDC. Its power consumption is controlled below 384mW (12VDC), and it can realize complete high-low voltage isolation, which can be applied to the main positive electrode or the main negative electrode of the battery system.

Sensor Information

| Part Number | Shunt Thickness | Resistance | Terminal Resistor |
|-------------------|-----------------|------------|----------------------|
| CB1000F8436A0KS00 | 4mm | 25μΩ | Yes |
| CB1000F8436A0KN00 | 4mm | 25μΩ | No |

7、Communication

7.1 CAN Protocol

CB1000F8436A applies CAN2.0 A/B communication protocol and communicates through data frame. The data length of message frame is between 1-8 bytes. The default CAN speed is 500Kbps. 1Mbps/250Kbps are also available. There are two kinds of data frame, standard frame and extended frame, as shown in Figure 7-1 and Figure 7-2. Standard frame has an ID of 11 bytes, and the extended frame has an ID of 29 bytes. The defaulted data frame is standard frame, which can be adjusted to the extended frame. The defaulted data format is Motorola, which can be adjusted to Intel.

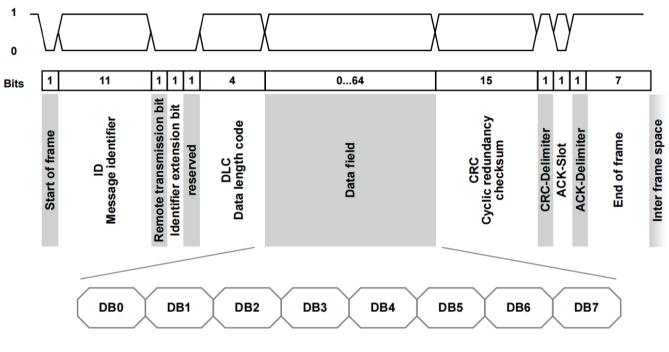

Figure 7-1S tandard Frame

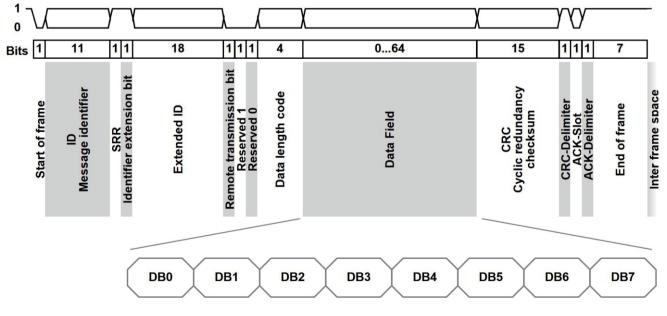

Figure 7-2 Extended Frame

7.2 Data Frame

The data frame of CB1000F8436A can apply multiple data formats, as shown in Table 7-1. Among them, both formats A and B are composed of two frames of messages, which transmit real-time current and real-time temperature. Both formats C and D are composed of one frame of message. Format C transmits real-time current and real-time temperature in one frame of message. Format D only transmits real-time current. The data frame format defaults to format A.

| Data Format Type | Data Frame Content | CANID ^[1] | Data Length | Characteristics |
|------------------|----------------------------------|----------------------|-------------|--|
| Format A | Real-Time Current | 0x0301 | 6 | 32-bit current value is a signed integer. Available Unit: mA/μA |
| | Real-Time Temperature | 0x0325 | 6 | 32-bit temperature value is a signed integer, in 0.1°C |
| Format B | Real-Time Current | 0x03C2 | 8 | 24-bit current value is an unsigned integer with offset 0x800000, in mA |
| FormatB | Real-Time Temperature | 0x06C2 | 8 | 8-bit NTC temperature value is a signed short integer, in °C 8-bit MCU temperature value is a signed short integer, in °C |
| Format C | Real-TimeCurrent& Temperature | 0x03C2 | 8 | 24-bit current value is an unsigned integer with offset 0x800000, in mA 16-bit temperature value is a signed short integer. Unit: 0.1 ℃ |
| Format D | Real-Time Current | 0x03C0 | 8 | 32-bit current value is an unsigned integer with offset 0x80000000, in mA |

[1] The CAN ID in the above table are default and can be modified by commands (refer to the relevant application documents for details)

7.2.1 Format A

Format A consists of current data frame and temperature data frame, each with a 4-bit cyclic counter and a 2-bit module exception flag. In addition, the current data frame has an 8-bit current channel flag, a 32-bit current value, a 1-bit unit selection and a 1-bit reserved bit. The temperature data frame has an 8-bit temperature channel flag, a 32-bit temperature value and a 2-bit reserved bit. The details of the message are shown in Table 7-2, Examples of message and decoding information are shown in Table 7-3 and Table 7-4.

Table 7-2. Format A Message

| Frame Type | CANID | Length | byte0 | byte1 | byte2 | byte3 | byte4 | byte5 |
|------------------------|--------|--------|---------------------|---|---|-------|-------|-------------------|
| Current (mA/µA) | 0x0301 | 6 | 0x00 ^[1] | B[7]: Reserved Bit ^[2] B[6]: Current Unit ^[3] B[5]: Measurement Error Flag ^[4] B[4]: Overcurrent Flag ^[5] B[3:0]: Cyclic Counter ^[6] | 32-bit Signed Current Value ^[7] | | 7] | |
| Temperature (0.1°C) | 0x0325 | 6 | 0x04 ^[8] | B[7:6]: Reserved Bit ^[2] B[5]: Overtemperature Flag of Shunt ^[9] B[4]:Overtemperature Flag of PCBA ⁽¹⁰⁾ B[3:0]: Cyclic Counter ^[6] | 32-bit Signed Temperature Val | | | e ^[11] |

[1] Current Channel Flag.

[2] Reserved bit, default is 0.

[3] Current Unit, 0: mA; 1: μA

[4] Measurement error flag, active when the ADC fault is detected, indicates that the current value is invalid. When alarming, the current sensor still sends and receives data messages, but the current value in the message is invalid. The measurement deviation may exceed the range specified in the technical specification.

[5] Overcurrent error flag. Default is inactive. It can be defined by the user.

[6] Cyclic Counter, 0x0-0xF cycle count value.

[7] 32-bit current data uses big-endian by default. The high bit is followed by the low bit. It is a signed integer.

[8] Temperature Channel Flag.

[9] Overtemperature Flag of Shunt, active when the shunt temperature is detected to be more than 150 °C, indicates that the sensor may have no message output or low accuracy. When alarming, the current sensor can still send and receive data messages in a short time, and the current value in the message is valid. If overtemperature for a long time, the performance of current sensor can be damaged. At this time, it is recommended to limit the output power of BMS.

[10] Overtemperature Flag of PCBA, active when the board temperature is detected to be more than 125 °C, indicates that the sensor may have no message output or low accuracy. When alarming, the current sensor can still send and receive data messages in a short time, and the current value in the message is valid. If overtemperature lasts for a long time, the performance of current sensor can be damaged. Then, it is recommended to limit the output power of BMS.

[11] 32-bit temperature data uses big-endian by default. The high bit is followed by the low bit. It is a signed integer. Unit: 0.1 °C

7.2.2 Format B

Format B consists of current data frame and temperature data frame, each with a 4-bit cyclic counter. In addition, the current data frame has a 24-bit current value, a 2-bit flag bit, an 8-bit software version, an 8-bit check bit and an 18-bit reserved bit. The temperature data frame has an 8-bit temperature value, a 4-bit status bit, an 8-bit check bit and a 32-bit reserved bit. The details of the message are shown in Table 7-5, Examples of message and decoding information are shown in Table 7-6 and Table 7-7.

| | | | i | | | | | | | |

Table 7-5. Format B Message

CB_AMC_UM - MAY 2023

[1] Cyclic Counter, 0x0-0xF cycle count value.

[2] Reserved bit, default is 0.

[3] Hardware Fault Flag, active when a hardware fault is detected, indicates that the ADC may have a fault.

[4] ADC conversion error flag. When ADC sampling timeout exceeded, indicating the present current value is invalid. When flag occurs,

the sensor can still receive and send message, but the current value of the message is invalid. The measured value may be out of the specifications range.

[5] 24-bit current data uses big-endian by default. The high bit is followed by the low bit. It is an unflaged integer. Unit: mA

The actual value is expressed as V=D-0x800000. D is the value in the message.

[6] CRC-8 Check generates a check code for the first 7 bytes of data.

 $[7] SHUNT over temperature flag. When measured temperature of SHUNT is over 150 ^{\circ}C, it will be no message or measurement accuracy decreased.$

 $When flag \, occurs, the \, sensor \, can \, still \, receive \, and \, send \, message \, in \, a \, short \, period \, and \, the \, current \, value \, in \, the \, message \, is \, normal.$

If the sensor is over temperature for a long time, it could affect the functions of the sensor. It is recommended to derate BMS output power.

 $[8] \ {\tt PCBA} \ {\tt over} \ {\tt temperature} \ {\tt flag}. \ {\tt When} \ {\tt measured} \ {\tt temperature} \ {\tt of} \ {\tt PCBA} \ {\tt is} \ {\tt over} \ {\tt 125^{\circ}C}, \ {\tt it} \ {\tt will} \ {\tt be} \ {\tt no} \ {\tt measurement} \ {\tt accuracy} \ {\tt decreased}.$

When flag occurs, the sensor can still receive and send message in a short period and the current value in the message is normal.

If the sensor is over temperature for a long time, it could affect the functions of the sensor. It is recommended to derate BMS output power.

[9] SHUNT temperature measurement error flag. Sign sets when SHUNT temperature measurement is error.

 $[10] \ {\sf PCBA} \ temperature \ measurement \ error \ flag. \ Sign \ sets \ when \ {\sf SHUNT} \ temperature \ measurement \ is \ error.$

[11] SHUNT temperature, 8-bit temperature data by default unflaged integers. Unit: °C. The actual value expression is V=D-55. D is the value in the message. [12] PCBA temperature, 8-bit temperature data by default unflaged integers. Unit: °C. The actual value expression is V=D-55. D is the value in the message.

| Example | D B 0 | DB1 | DB2 | D B 3 | DB4 | DB5 | DB6 | DB7 |

| | DB7 | 0x47 | CRC- 8 Check Value |

7.2.3 Format C

Format C consists of one frame of message, including a 24-bit current value, an 16-bit temperature value, a 4-bit cyclic counter, a 2-bit status bit, a 1-bit flag bit, an 8-bit check bit and a 9-bit reserved bit. The details of the message are shown in Table 7-8, Examples of message and decoding information are shown in Table 7-9 and Table 7-10.

Table 7-8. Format C Message

| Frame Type | CANID | Length | byte0 | byte1 | byte2 | byte3 | byte4 | byte5 | byte6 | byte7 |
|---|--------|--------|--|-------|-------------------------------------|--------|---------------------------|--------|--------------------------------|--|
| Current (mA) Temperature (0.1°C) | 0x03C2 | 8 | B[7:4]: Cyclic Counter ^[1] B[3:2]: Malfunction Status ^[2] B[1]: Hardware Fault Flag ^[3] B[0]:Reserved Bit ^[4] | Curre | bit Unsigr nt Value (x800000 | Offset | 16-bit S Tempe Valı | rature | Reserved Bit ^[4] | CRC-8 Check SA E J1850 ^[7] |

[1] Cyclic Counter, 0x0-0xF cycle count value.

[2] Malfunction Status, '0': Normal; '1': ADC Conversion Error; '2': Current exceeds 1550A; '3': Shunt temperature exceeds 150 °C or PCBA temperature exceeds 125 °C.

[3] Hardware Fault Flag, active when a hardware fault is detected, indicates that the ADC may have a fault.

[4] Reserved bit, default is 0.

[5] 24-bit current data uses big-endian by default. The high bit is followed by the low bit. It is an unsigned integer. Unit: mA

The actual value is expressed as V=D-0x800000. D is the value in the message.

[6] 16-bit temperature data uses big-endian by default. The high bit is followed by the low bit. It is a signed integer. Unit: °C.

[7] CRC-8 Check generates a check code for the first 7 bytes of data.

| | Table 7-9. Examples of Format C Message Frame | | | | | | | | |
|---------|---|------|------|-------|------|------|------|------|--|
| Example | DB0 | DB1 | DB2 | D B 3 | DB4 | DB5 | DB6 | DB7 | |

| 2 | 0x00 | 0x7F | 0xFC | 0x18 | 0xFE | 0xF6 | 0x00 | 0x9D | |

Table 7-10, Decoding Information of Table 7-9 Examples

| | lable 1-10. Decouing mormation of rable 1-5 Examples | | | | | | | | |
|---------|--|----------|--|--|--|--|--|--|--|
| Example | Byte | Value | Message | | | | | | |
| | D B0 | 0x00 | Cycle sequence 0, normal function, no hardware fault, reserved bit 0 | | | | | | |
| | DB1-DB3 | 0x8003E8 | Current: 1000mA , i.e. +1A | | | | | | |
| 1 | D B4-D B5 | 0x010A | The Temperature i s + 26.6 °C | | | | | | |
| | DB6 | 0x00 | Reserved bit 0 | | | | | | |
| | DB7 | 0x2E | CRC- 8 Check Value | | | | | | |
| | D B0 | 0x00 | Cycle sequence 0, normal function, no hardware fault, reserved bit 0 | | | | | | |
| | D B1- D B3 | 0x7FFC18 | Current: -1000mA, i.e1A | | | | | | |
| 2 | D B4- D B5 | 0xFEF6 | The Temperature i s - 26.6 °C | | | | | | |
| | DB6 | 0x00 | Reserved bit 0 | | | | | | |
| | DB7 | 0x9D | CRC- 8 Check Value | | | | | | |

7.2.4 Format D

Format D consists of one frame of message, including a 32-bit current value, a 1-bit flag bit, a 7-bit status bit, an 8-bit software version, a 16-bit reserved byte and no temperature value. The details of the message are shown in Table 7-11, Examples of message and decoding information are shown in Table 7-12 and Table 7-13.

| Table 7-11 | . Format D | Message |
|------------|------------|---------|
|------------|------------|---------|

| Frame Type | CANID | Length | byte0 | byte1 | byte2 | byte3 | byte4 | byte5 | byte6 | byte7 |
|-----------------|--------|--------|-------|------------------------------------|-------|-------|---|-------------|-------|---------------------|
| Current (mA) | 0x03C0 | 8 | | 2-bit Uns Current fset 0 x80 | 0 | | B[0]:Error Flag ^[2] B[7:1]: Error Status ^[3] | Rese Bit | | Software Version |

[1] 32-bit current data uses big-endian by default. The high bit is followed by the low bit. It is an unsigned integer. Unit: mA. The actual value is expressed as V=D-0x80000000. D is the value in the message.

[2] Error Flag, '0': Normal; '1': Error;

[3] Error Status, 0x64: no error; 0x50: ADC hardware error; 0x51: ADC conversion error; 0x60: Temperature exceeds the limit (current value remains measured).

[4] Reserved bit, default is 0.

Table 7-12. Examples of Format D Message Frame

| Example | D B 0 | DB1 | DB2 | D B 3 | DB4 | DB5 | DB6 | DB7 |

| | D B0- D B3 | 0x800003E8 | Current: 1000mA, i.e. 1A |
| 1 | DB4 | 0xC8 | N ormal, no error |
| | D B5 - D B6 | 0x0000 | Reserved bit 0 |
| | DB7 | 0x64 | Software version is V 1.00 |
| | D B0- D B3 | 0x7FFFFC18 | Current: - 1000mA, i.e 1A |
| 2 | DB4 | 0xC8 | N ormal, no error |
| 2 | D B5 - D B6 | 0x0000 | Reserved byte 0 |
| | DB7 | 0x64 | Software version is V 1.00 |

7.3 Bus Topology

CB1000F8436A can be applied to a bus-type topology and transmits network information to each node through the bus, as shown in Figure 7-3.

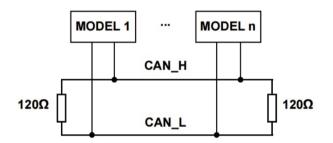

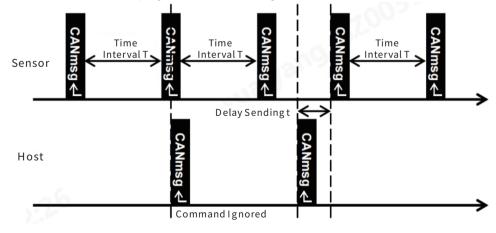

Figure 7-3 CAN Bus Topology

7.4 Measuring Mode

7.4.1 Time Interval + Command Trigger Mode

The sensor samples data at a fixed time interval set by the system and sends message to the CAN bus. At the same time, It can also respond to the trigger command. In the sampling period, the measurement will be active immediately when the trigger command is received and sends message to CAN bus. No need to wait for next sampling interval. As shown in Figure 7-4.

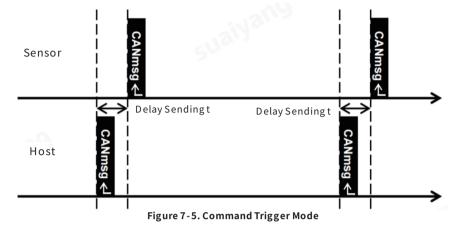

After the sensor receives the trigger command, if it is sampling or sending CAN message, the p resent trigger command will be ignored. When the command is valid, a sampling and sending process will be started, and the time interval T for the next sending will be automatically calculated from the moment of this trigger. As Figure 7 - 4 shown, there is a delay between the sensor receiving a valid trigger command and sending the CAN message, which is less than 1 ms.

7.4.2 Command Triggered Mode

Under this mode, the sensor will not automatically send message, but keep sampling, calculating and filtering data at a fixed time interval. The sensor will send the recent sampling data to CAN bus and reset the start of time interval when a valid command is received from the host, as Figure 7 - 5 shown.

As Figure 7 - 5 shown, the sensor sends data to the CAN bus after receiving at rigger command from the host, with a delay of less that 1 ms between receiving the command and sending the data.

8、Mechanical Structure

8.1 Dimensions

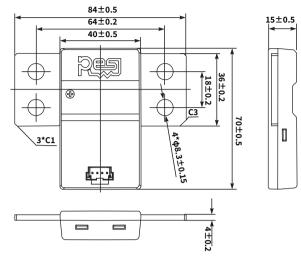

Figure 8.1 Structure Diagram

8.2 Copper Bar Connection

- Recommended Bolts: M8
- Recommended Torque:15- 20Nm
- Recommended Width * Thickness of Copper Bar:40mm*5mm
- Recommended Length of Overlap between Shunt and Copper Bar:20mm
- Do not use a flat washer between the copper bar and the shunt
- Keep the surface of shunt and copper bar clean and free of scratches

Figure 8-2. CB1000F8436A Copper Bar Connection Diagram

8.3 Connector

| Connector | Manufacturer | Pin Count | Part # | | | |
|---|--------------|-----------|------------|--|--|--|
| Male Connector ^[1] | Molex | 4 | 5600200420 | | | |
| Recommended Female Connector ^[2] | Molex | 4 | 5601230400 | | | |

8.4 Connector Definition

| Pin No. | Description |
|---------|-------------|
| Pin4 | VCC |
| Pin3 | CAN_L |
| Pin2 | CAN_H |
| Pin1 | GND |

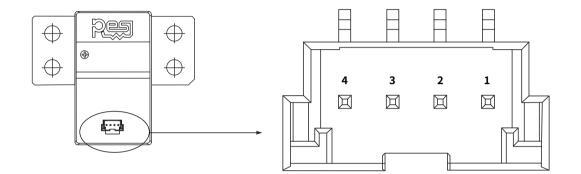

Figure 8-5. Male Connector Molex5600200420

9、Typical Applications

CB1000F8436A⁽¹⁾ is used for accurate current measurement in key system. It is recommended that the current sensor connects to the circuit of positive or negative electrode of high-voltage end^[2], as shown in Figure 9-1 and Figure 9-2, to sample the current in the main circuit. The high and low voltage ends are galvanic isolated inside the sensor. It is recommended that the low voltage end connects to the battery management system, as shown in Figure 9-3, for real-time and accurate reporting of current data in key system.

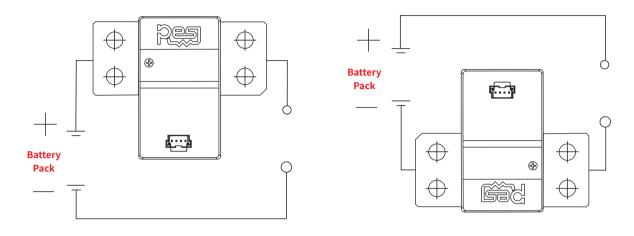

Figure 9-1. Recommended Use of Positive Electrode of High-Voltage End Figure 9-2. Recommended Use of Negative Electrode of High-Voltage End

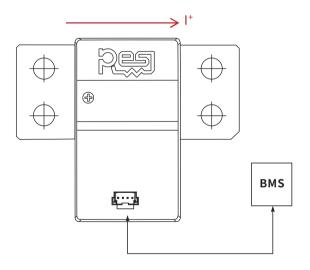

Figure 9-3. Recommended Use of Low-Voltage End

 [1] The "+" on the CB1000F8436A current sensor housing is the direction of current entry, that is, the positive current direction.
 [2] The high voltage electrode is installed as shown in the figure. The operating condition indicated by the sensor output value is: When the sensor outputs positive value, the battery pack is discharging; When the sensor outputs negative value, the battery pack is charging.

10、Storage & Packaging

10.1 Storage

- Recommended storage at room temperature.
- The storage environment shall be clean, tidy, dry and free of harmful gases, and the packaging case shall be protected from direct sunlight.
- Anti-static bracelet or anti-static gloves shall be worn during installation, storage and handling.

10.2 Packaging

10.2.1 General Information

| Packaging Element | Specifications | | | | |
|---------------------------------|----------------|----|--|--|--|
| SN P ^[1] | 150 | | | | |

Disclaimer

This disclaimer is applicable to the purchaser or user (hereinafter referred to as "user") of electronic products produced by Shenzhen C&B Electronic Co., Ltd. and its affiliated companies (hereinafter referred to as "C&B") or produced by a third party.

Unless individually stated in writing, the technical and reliability data (including datasheets), design resources (including reference designs), application or other design suggestions, network tools, security information and other resources related to this document provided by C&B are subject to change without notice. Users should check and obtain the latest relevant information before ordering C&B products, and verify whether the information is latest and complete.

C&B provides the information of this document "according to original product". C&B does not guarantee that there is no defect and does not make any express or implied warranty, including but not limited to merchantability, examples, implied meaning and typical value.

The information contained in this document is based on laboratory conditions, and the statement that the product is suitable for specific applications is based on the understanding of the typical requirements of C&B for general use. The characteristics and parameters of C&B Products in the user application may be different from those in the datasheet due to (i) the combination of C&B Products with other components in the user application, or (ii) the user application environment. The characteristics and parameters of C&B products may and do vary in different applications, and the actual performance may change over time. Users should always verify the actual performance of C&B products in their specific equipment and applications, and independently determine how many additional test margins should be added to their equipment or applications to fill the gap between the laboratory and the actual conditions.

The maximum value written in this document is that this product can withstand without damaging the product. However, due to approaching the maximum value or exceeding the maximum value, C&B cannot guarantee the electrical and mechanical characteristics of the product, and cannot ensure that the product can work normally under the absolute maximum rated value. Users of C&B shall run all necessary tests on the product and its application to avoid potential defects or failures of the product and application, or the product or application of the customer's third party customers. C&B shall not be liable for this.

This document does not convey or imply any license of trademarks, patents and any other intellectual properties. C&B shall not be liable for any infringement of intellectual property or other rights of third parties that may result from the application of this document and the use of the company's products.

To the maximum extent permitted by law, C&B will not assume (i) any and all liabilities for any special, punitive, consequential, incidental or indirect damages or loss of income or profit (including but not limited to savings losses, business interruption and other costs or rework costs related to the disassembly or replacement of any product), or (ii) any and all implied warranties, including implied warranties of fitness for a particular purpose, non-infringement and merchantability. Whether such loss is based on tort (including negligence) warranty, it can be used as the theoretical basis for breach of contract or any other law.

For any loss of customers caused by any reason, the total and cumulative liability of C&B to customers for the products described in this document is limited by the terms of the contract or agreement signed between C&B and users.
